Overview

Technological innovation is an extended concept of innovation. While innovation is a rather well-defined concept, it has a broad meaning to many people, and especially numerous understanding in the academic and business world. Innovation refers to adding extra steps of developing new services and products in the marketplace or in the public that fulfill unaddressed needs or solve problems that were not in the past. Technological Innovation however focuses on the technological aspects of a product or service rather than covering the entire organization business model. It is important to clarify that Innovation is not only driven by technology.

Objectives:

The main objectives of the program are:

- To explore the opportunities due to pandemic
- To discuss the challenges that faced in the pandemic
- To overcome the challenges and creating an opportunity

Outcomes:

The outcomes of the program are to

- Managing Finances
- Diversify your business
- Hire the right people and be flexible
- Mergers and Acquisitions

Resource Person:

Ms.Praveena Bheemavarapu-Vice President of Technology at State Street, Hyderabad, Telangana

Summary Report on Technology Innovation

Technological innovation is the process where an organization (or a group of people working outside a structured organization) embarks on a journey where the importance of technology as a source of innovation has been identified as a for increased market competitiveness new innovation-questions The wording "technological innovation" is preferred to "technology innovation". "Technology innovation" gives a sense of working on technology for the sake of technology. "Technological innovation" better reflects the business consideration of improving business value by working on the product or services' technological aspects. Moreover, in a vast majority of products and services, there is not one unique technology at the heart of the system. The combination, integration, and interaction of different make the product or service successful. A technological innovation is a new or improved product or process whose technological characteristics are significantly different from before. Implemented technological product innovations are new products (product innovations) or processes in application (process innovations) that have been brought to market. The product or process is considered to be an innovation if it achieves specified advantages for the enterprise concerned; these need not be new from the point of view of other companies or the market.

Technologic Advances

Major advances in technology have enabled us to continue to push the boundaries of systems biology. The first sequencing approach, Sanger sequencing, was built on the principle that multiple clonal copies of fragments of DNA could be sequenced, where genome scaffolds could be constructed to cover entire regions of interest (e.g., gene or genome). However, the incorporation of a region of interest into either a plasmid or phage that could then be expanded into many clonal copies was a laborious, time-intensive process, taking up to 1 week for the preparation alone.
